

# Sliding Komfort Latch®

In response to feedback from drivers and managers, LifeGuard Technologies®, a division of IMMI, has developed a number of technologies that work with the seat belt to make the driver's ride safer and more comfortable. Komfort Latch®, introduced in 1986, removes seat belt irritation that results from constant pressure of seat belt contact with the occupant's upper torso.

Sliding Komfort Latch, introduced in 2003, offers a breakthrough in seat belt comfort and convenience by automating the process of releasing seat belt tension. This provides the driver with freedom of movement to reach dash controls, monitor side view mirrors from different angles, and make full steering wheel rotations, all without releasing the Sliding Komfort Latch.

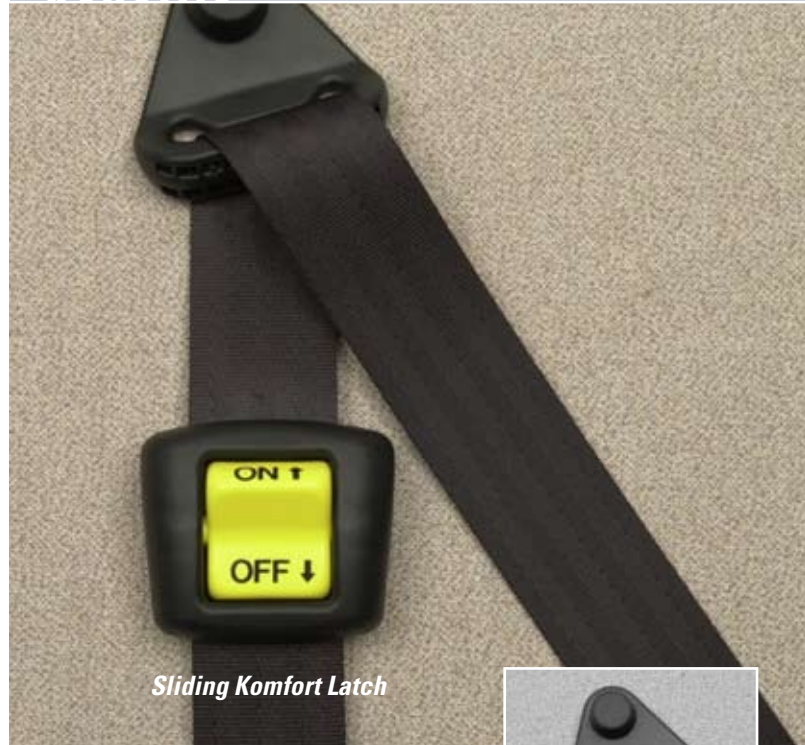

The driver sets the Sliding Komfort Latch by pushing the "on" button, thus positioning the device to allow a preset amount of slack (approximately one inch), relieving the pressure of the seat belt on the occupant. Sliding Komfort Latch allows the seat belt to extend/retract approximately five to seven inches, allowing the driver to lean forward or make other movements without the latch releasing.

As the driver returns to a normal driving position, the latch maintains the preset amount of slack.\* Upon removing the seat belt, the Sliding Komfort Latch is deactivated by a push of the "off" button or a tug on the upper torso portion of the seat belt.

*For more information on adding Sliding Komfort Latch as an option on Class 8 trucks, contact IMMI at 317.896.9531.*

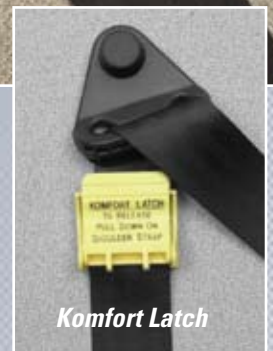

*\*If the vehicle experiences a sudden deceleration at any time while the Sliding Komfort Latch is in use, the device will disengage, allowing the retractor to fully tighten the belt.*

## benefits

*Sliding Komfort Latch*

- Easy to use
- Improves seat belt comfort, leading to increased usage
- Provides greater freedom of movement

*Komfort Latch*
